

November 3, 2016

Dear Montgomery Selectboard,

I have read the letter addressed to Montgomery Selectboard dated August 25, 2016. The Hurtubise family has been farming the Montgomery land for sixteen years. They showed me the nutrient plan, which through soil tests provides the information of the amount of manure that can be applied, according to the amount that the crop will use. They explained that their farm permit which is called an MFO, medium farm operation, requires grass buffers and spread setbacks to all fields. They informed us that by injecting spring manures within hours of spreading will control runoff. We understand their concern about quality of life and we are looking into direct injection which would greatly improve air quality. With the information that has been mentioned we ask that you consider our request to rent the town land to the Hurtubise family.

Dear Montgomery Selectboard,

The Hurtubise family rents our land and is allowed to apply manure according to RAP's, required agricultural practices. This is part of the MFO permit which requires grass buffers and spread setbacks that controls run-off of any manure into waterways. Additionally, as manure was applied it was injected within hours, which also prevents run-off and improves air quality. With the information that has been mentioned we ask that you consider our request to rent the town land to the Hurtubise family.
